

Learning CSS is pretty fun, because I love design so much. Giving my website some color make it looks more interesting to read. And I had learned how to design the website by adding box, changing color, font size and color, background color and more.

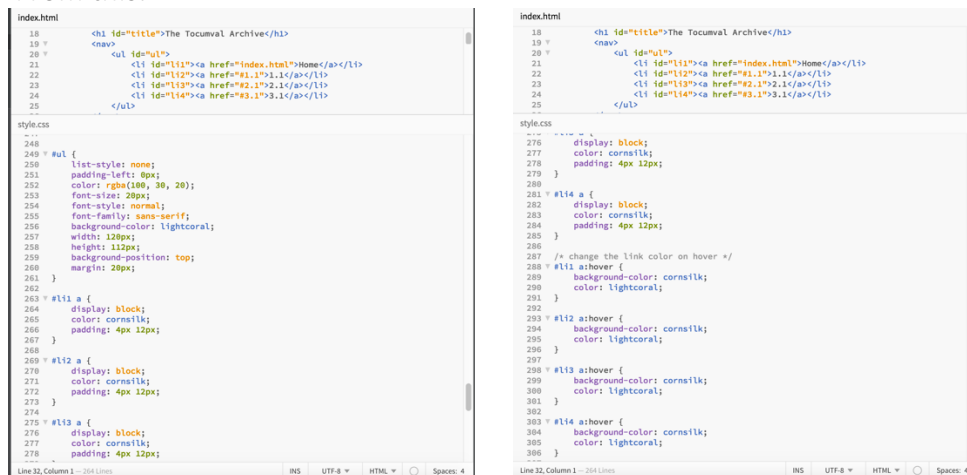

I am giving my title a border by 'border: 5px solid rgba(100, 30, 20)'. In the border part, we can also choose different pattern for the outline of the border, like dotted, dashed, solid, double, groove and more.

I reference from the w3schools a lot. Riley was my tutor during class but after class, my tutor was w3schools. So I just have a look from the CSS tutorial and also CSS advanced.

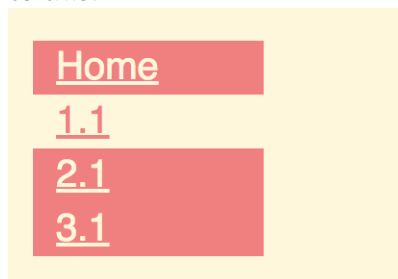

To make it looks better, I had try this vertical navigation bar in my website, and it works really well.

From this:

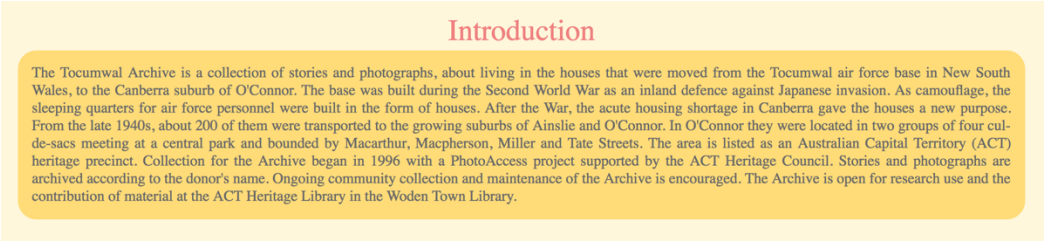

to this:

And also, I give a background color for the introduction article and make it look like a box.  
From this:

```
style.css
37 h3 {
38   color: lightcoral;
39   font-size: 200%;
40   text-align: center;
41   padding-bottom: 5px;
42 }
43
44 #p1 {
45   color: dimgray;
46   text-align: justify;
47   border-radius: 20px;
48   background: rgba(300, 220, 120);
49   padding: 15px;
50   margin-right: 30px;
51   margin-left: 30px;
52   margin-bottom: 30px;
53   line-height: 1.2em;
54 }
```

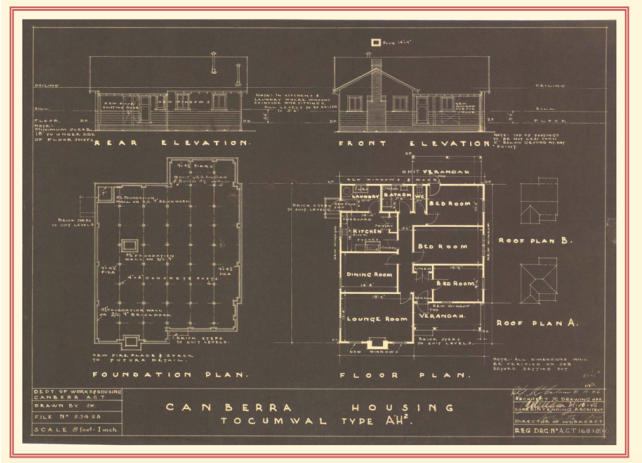

to this:

Beside, I also gave all of my picture an outline to make it looks more fun.  
From this:

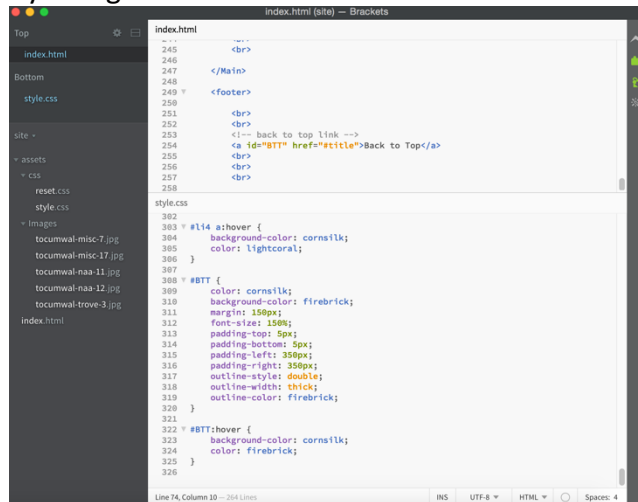

```
style.css
178 padding-right: 10px;
179 padding-top: 10px;
180 }
181
182
183 #imgbox2 {
184   display: block;
185   margin-left: auto;
186   margin-right: auto;
187   outline-style: double;
188   outline-color: indianred;
189   outline-width: thick;
190   padding-left: 10px;
191   padding-bottom: 10px;
192   padding-right: 10px;
193   padding-top: 10px;
194 }
195
196
197 #imgbox3 {
198   display: block;
199   margin-left: auto;
200   margin-right: auto;
201   outline-style: double;
202   outline-color: indianred;
203 }
```

to this:

From week4's tutorial, the favorite things I learned is the hover.

By doing this:

When it doesn't been selected:

When it has been selected:

Giving more space to the articles by adding the line-height to each paragraph.

I also give a shadow to my title, because it's the biggest font in the website. Thence, giving some pattern can attract audience's attention.

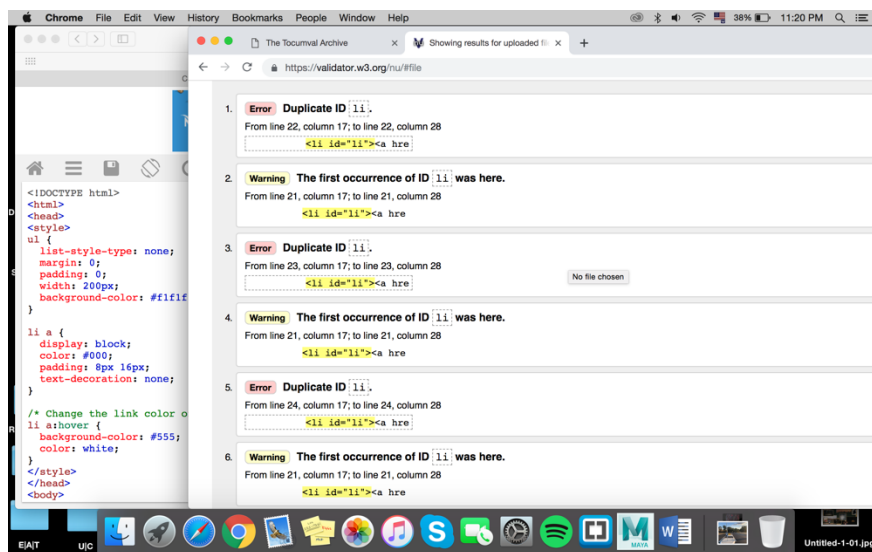

Another thing that I learned from tutorial are padding is giving space inside the box, while margin, is giving space outside the box.

For the colors, I use cornsilk as background, firebrick as my big title with lightcoral shadow. By using dimgray instead of black on all the article text can really match the other colors that I had choose for this website. This website is a combination of cornsilk, firebrick, and lightcoral for most of the elements. And I am using indianred for the outline of all the images, because it looks similar with firebrick. I did not used many type of color because it might make the website looks complicated. And I really likes all the colors that I arrange for this website.

Issue:

I put my html to <http://validator.w3.org> to check is everything in the correct way or not. But end up showed many error from my html. Which I duplicated ' p class="p1" id="p1" ' in every paragraph. I was wondering we can't do duplicate in the html file? Then I asked google that can we do duplicated on html? And the answer showed up with ID value can be given to only one HTML element. In other words, multiple elements cannot have the same id value on the same page. Then I just make more ID for each paragraph. From p1 to p17. As case with image as well. So all I did was just make more ID instead of duplicated.

I realized that we have to do many ID instead of duplicated it.

solution:
